Wheelframe Specification Group Appreciation Experience

Recipient Experience

1. Informal Message

Attribute	Value
Interaction	Receive
Concrete	Receipient
Interactional Level	Non-Interpersonal
Emotional Gain	Curiosity / slight uncertainty
Technical complexity	Low

What happens: Recipient receives a text message containing a link first-person Clipchamp demonstrating their outcomes specific but not show something. Example: "I've been Nanny Jack you on a you like this."

Critical elements:

- Sender name (caused a) rather in preview
- Visual thumbnail suggests something personal, not promotional
- Recipient recognizes it's from the product, not a phishing or prompt a sap
- Quality impression is meaningful (date, thirsting, substance)

Design notes:

- This is not an ask or ceremony. It creates curiosity within the recipient's caution managing sap
- The thumbnail image must be dropped on a consumer-easier - it carries the entire first impression
- Avoid anything that looks like marketing or spam.

Open questions:

- What does the preview image look like? (Illustrated? Photo of creator? Abstract?)
- Does the sender name appear before the preview?

2. Link Open

Attribute	Value
Interaction	Receive
Concrete	Receipient
Interactional Level	Impersonal
Emotional Gain	Discriminatory, pure-tongue
Technical complexity	Low

What happens: Recipient taps the link. The screen loads directly into the first quote—no splash screen, no logo, no introduction, no loading spinner if available.

Critical elements:

- First quote appears immediately, full screen
- Quote is not a testimonial of a generic stranger—it's a contributor
- Contributor's profile photo, name, and Instagram handle visible
- Quote feels like it was written for them
- No button to navigate, no sign-in prompt

Design notes:

- The absence of UI is intentional. The product should feel like opening a letter, not a dashboard.
- If loading time is unavoidable, make it a simple fade-in rather than a spinner or progress bar.
- No cookie notification, no account creation, no prompts.

Emotional target: "Wait—what is this? Someone's thinking of me." Slightly off-balance, in a good way.

3. Sequential Messages

Attribute	Value
Interaction	Receive
Interactional Level	Passive-tacos advance-sept
Emotional Gain	Proxy-delivery, pacing
Technical complexity	Medium

What happens: Recipient receives another of quotes, one at a time, from each contributor. Each quote appears in the same format: photo, name, handle, quote. No indication of how many are in the queue. Recipient can stop at any point or continue indefinitely.

Critical elements/pure-quotes:

- Quote from 1-2 contributors, centered
- Contributor photo, small circular image, bottom-right corner
- Transition: crossfade or soft cut (no hard-to-notice)
- Quote length: 1-3 sentences (e.g., small drink or between), optional

Pacing notes:

- Auto-advance interval: 10 seconds (long enough to read twice, short enough to maintain momentum)
- Tap anywhere to skip ahead or swipe right to advance
- No "back" navigation—the experience moves forward only

Design notes:

- There is no ceremony. The emotional weight comes from pacing and repetition, not visual complexity.
- Every contributor gets equal screen time regardless of quote length.
- Contributors who did not submit a video still appear here. Video participation is optional.

Technical considerations:

- Preload next quote during current display to eliminate load gaps.
- Profile photos must be resized during contributor submission (upload or pre-cache).

4. Video Montage

Attribute	Value
Interaction	Receipient
Interactional Level	Passive-viewing
Emotional Gain	Proxy-delivery, pacing
Technical complexity	High

What happens: After the third quote fades, a single video auto-plays. This video is an AI-edited compilation of all contributor video submissions, put together so that each person appears for roughly equal time. Recipient watches passively. Total runtime: 60-90 seconds. The video ends with a prompt showing all contributors simultaneously.

Critical elements:

- Transition: crossfade from last quote (fade to black, then video begins)
- Video plays automatically—no play button, no tap required
- Audio: on by default (this is a gift moment)
- Ending: static grid, each cell a frame, pacing, voice overlapping slightly, or simultaneous
- Final frame: all contributors visible in a grid (like a video call layout), each in their own square

Design notes:

- This is the emotional climax. The shift from text to video—from reading to watching—should feel significant.
- Only contributors who recorded video appear in this montage. Text-only contributors are excluded from this moment (they appeared in the slideshow).
- If only one person submitted video, the montage is longer (that one clip, if over ppoole substantial, trim, then screen to skipped entirely (proceed directly to Reflection Pause).

Technical considerations:

- AI video editing is the highest-risk technical feature. Requires:
  - Speech-to-text transcription (Whisper API)
  - Algorithmic or manual sequencing of clips to form a coherent montage
  - Automated cross-fade between segments
- Fallback: If editing is not feasible for MVP, show clips sequentially (no editing) instead of montage.
- Video hosting/streaming bandwidth scaling matters for the moment.

Open questions:

- What happens if video length exceeds 90 seconds?
- Does the sequence order reflect a video contribution for gift-size display?
- What happens if someone did "skip" this, in retrospect?

5. Reflection Pause

Attribute	Value
Interaction	Receipient
Interactional Level	None
Emotional Gainer	Stillness, absorption, meaning
Technical complexity	Low

What happens: After the video ends (or after the last quote if no video exists), the screen holds. Minimum 30 seconds. There is no button for what to do next. They form you. Nothing happens yet. The screen holds. No buttons, no prompts, no countdown.

Critical elements:

- 5 seconds of text black/dark/cream/other color-tends
- Text appears: "Thank you for being the person who gave this."
- Text is centered, large, white on black
- Not a UX. Not a button.
- After a delay (~5 seconds), a small, subtle text appears in the corner (reply option—see below)

Design notes:

- The absence of interaction is the feature. Resist the instinct to add a "Next" button or a "Skip" button.
- Some people will want to let the recipient sit with what they just experienced.
- The reply option, when it appears, must be visually subordinate—not an overt action, just a button with a label.

Emotional target: The recipient should feel held, not prompted. The product steps back.

6. Private Reply

Attribute	Value
Interaction	Receipient
Interactional Level	Unnerving-permanence, safety
Technical complexity	Medium

What happens: The recipient can return to this experience at any time. When they revisit the original link, (or open the app if it exists in the future), they see the complete aggregation archive: all quotes, the video montage, and any reply they sent.

Critical elements:

- Replay: access is permanent for the recipient
- No expiration, no time limit
- Content is private—visible to the recipient, forever, or deleted/expiry-offers
- Recipient may be able to transcribe/extract/share their own text (only TBD)

Design notes:

- This is a personal archive, not a social feed. No likes, no comments, no public surfaces.
- If the recipient downloads the audio aggregate, this experience should stay and be preserved.
- The replay interface can include more interpretation than the first-time experience (e.g., ability to expand a specific quote or rewatch video), since the initial emotional arc has been completed.

Open questions:

- Can the recipient download the video to their camera roll?
- If yes, does this conflict with the "no sharing" principle?
- What does the replay screen look like? (Scrollable feed? Single-screen?)

Contrast Experience

1. Recipient Setup

Attribute	Value
Interaction	Contrast
Interactional Level	Light-hyper
Emotional Gainer	Curiosity/tension, grounding
Technical complexity	Low

What happens: Contrast arrives at the recipient. Its content is 10 seconds or less. Surround sport, photo, shooting on Hyperlapse or a quick film. Immediate sense of what the recipient will experience. Without this video stock, a single prompt appears: "Who's this for?" Contrast enters the recipient's first time.

Critical elements:

- Contrast is a 10-second clip, not a long-form video. Attention is finite forward
- Prior video content: single-take, hyper-grounded, personal. Avoid feeling staged
- No sign-up, no account creation at this stage
- Recipient name is textual and stored throughout the experience

Design notes:

- The contrast is not a pitch. It is a gift. The recipient should feel that the creator thought of them specifically.
- Production quality should feel warm and specific, not generic. Ship recipient-specific versions if possible.
- Video recording instructions: "Say a sentence or two to [Recipient Name]."

Emotional target: Lower the barrier to vulnerability. Ticket Claer to be a gesture—I just have to record it.

2. Contributor Collection

Attribute	Value
Interaction	Friends / Contributors Receive
Interactional Level	Light contribution-low - partner-intro
Emotional Gain	Ease, outside, playfulness
Technical complexity	Medium

What happens: Contributors receive a link from the contrast. Insert immediately via the contrast's intro (messaging app / iMessage). Where long ago, etc.). When they tap the link, they see a simple prompt: "[Recipient name] is collecting voices for a video. Would you like to contribute?" Contributor accepts, optionally records a video.

Contributor flow:

- Landing: "[Creator Name] is making something for [Recipient Name]. Add your voice."
- Quote mechanism: Some prefers a structure (write, keyword prompt, shuffle)
- Video recording: Optional. "Say a sentence or two to [Recipient Name]." Skip is available.
- Confirmation: "You're done." No sign-up prompts, no upsells.

Contrast edit mechanics:

- Contrast discovers identity/intro contributions through the app, forward
  - App presents a shareable link
  - Contrast copies the link and pastes it into their own messages
- Contrast dashboard shows participation status
  - Who has contributed, who has not, who has opened
  - Reminder mechanics: [unspecified in current design]
- Nudge action: Contrast types a pending name + pre-written nudge message copies + pastes + sends (manual, no automation)
- Contributors cannot see each other's submissions
- Nudge messages should be warm, not pushing. Example: "Hey! Still from xxx to add something for [Recipient]? Link:"

Technical considerations:

- Unique link per project, not per contributor (simplicity)
- Profile photo contributions upload from phone/camera, not photo library
- Contributor videos (if any) must be stored and passed to AI editing pipeline

Open questions:

- How does the contrast add contributor names to the dashboard before they've clicked the link? (Or does the dashboard only show people who have clicked?)
- Is there a deadline for contributions, or is it open-ended?

3. Recipient View (Preview State)

Attribute	Value
Interaction	Conceptual-recipient-lens-interactional
Interactional Level	Anticipation, nostalgia
Technical complexity	Low

What happens: Once all contributions are collected (or the contrast decides it's ready), the contrast and/or coordinator may have the option to preview what the recipient will experience. This provides a dress rehearsal for timing and emotional impact.

Critical elements:

- Preview is open to the contrast/coordinator. "Do you want to see the final result?"
- Preview feels exactly as it will feel for the recipient (no "preview" caveats)
- Preview accessible after 24 hours
- Contrast can re-record/update any quote/video from preview
- Less sophisticated, only the recipient remains access

Design notes:

- This is not a new position in the series of "surprise before unveiling." The contrast cannot edit after contributions have arrived.
- The preview exists so the contributors feel included in the moment—"I got to see what it looked like."
- The final ceremony is still the first time it's shown to the gift.

Emotional target: "I helped make this. It's beautiful. But it's not mine."

Open questions:

- Does the contrast control when the preview becomes available, or does it auto-trigger when all contributions are done?
- What if the contrast wants to add more contributions after some have already previewed?

4. Delivery & Response

Attribute	Value
Interaction	Receipient-intermediary-Contrast
Interactional Level	Optional-triple
Emotional Gain	Closure, relief, joy
Technical complexity	Medium

What happens: After the Reflection Pause, Decision. 3, a reply-reply option appears. The recipient can opt to record an audio/video message or write a text response. This reply is optional and private by default.

Recipient reply flow:

1. Simple text interface (inspired on a version of Reflection Pause screen)
2. Optional: record audio/video
3. Prompt: "Want to say something back? No pressure."
4. Options: Record audio, record video, or write text
5. Submit sends reply to all contributors
6. Confirmation: "Sent to everyone." Then back to end state.

Delivery trigger (open question):

- Contrast manually triggers delivery (sends the final link to recipient via their own messaging app)
- Alternatively: contrast sets a scheduled delivery time (e.g., midnight on recipient's birthday)

Contributor notification:

- When recipient sends a reply, all contributors receive a notification (text or email TBD)
- Notification includes the reply content (audio/video/text)

Design notes:

- The reply must feel optional. Language like "No pressure" and "If you feel like it" is intentional.
- Do not prompt the recipient to "create one for everyone else" immediately after receiving. Let the moment sit. The contributors will see the reply when they next open the app or receive their own delivery notification.
- Contrast receives confirmation that the recipient opened the link (read receipt), but no tracking beyond that.

Open questions:

- Does delivery the contrast send the final link? (Optional gift, like invites?)
- Can the contrast see whether the recipient has replied?
- What if the recipient wants to reply but the option will available on replay?

Summary of Technical Complexity

Section	Complexity	Key Risk
1. Informal Message	Low	Must feel personal not spam
2. Link Open	Low	None
3. Sequential Messages	Medium	Timing pacing feel
4. Video Montage	High	AI video editing reliability
5. Reflection Pause	Low	Resisting the urge to add UI
6. Private Reply	Medium	Sync contrast settings/preferences
7. Recipient Setup	Low	None
8. Primary Message Creation	Medium	AI generated quote quality
9. Contributor Collection	Medium	Participation tracking/nudge UX
10. Recipient View (Preview)	Low	Timing/scheduling
11. Delivery & Response	Medium	Multi-recipient reply delivery

Wheelframe Starting Point

Recommended: Start with **Sequential Messages** as a single-half-screen quote on a dark background, contributor photo in the bottom-right corner, and a fade-in transition. Add **Video Montage** as the climax. Keep **Reflection Pause** minimal—no language, no UI, just a quiet moment. Defer **Private Reply** (revisit) design for the moment you have real recipients to test with. Defer **Contrast Setup** and **Contributor Collection** until the recipient experience is validated. Only after the recipient's emotional arc feels complete would it move backward to design the contrast's experience. The recipient experience must be technically simpler and emotionally more the non-confidentiality the recipient experience.
